

I built a  
hospital EMR.  
*Solo.*

Now in testing with real clinicians. Here is what it took.

# Patient records that *vanish*.

In low-resource clinics, a patient's history lives on paper, if it lives at all.  
Continuity of care breaks at the first lost file.

# Nexa-Health *Welbodi.*

An EMR built for how clinics actually work.

- **Lifelong patient records** one chart, for life
- **Offline-first** for low-connectivity facilities
- **Role-based access** for real clinic teams
- **AI-assisted end to end** from schema to UI

WHERE IT IS

# Live with real *clinicians.*

In user testing at a referral hospital, with testers running it on real workflows.

STATUS · IN UAT

## THE LESSON

# Domain depth beats *speed*.

Years in public health told me what mattered. AI just let me build it fast.

YOUR MOVE

Got a system  
that's *breaking*?
