

CONTRARIAN TAKE

Sierra Leone is a
great place to build
software.

Not despite the constraints. Because of them.

"Build in the Valley or *go home.*"

The story says real software comes from places with capital, talent density, and fast internet. I build somewhere else.

Constraints make *better products.*

- **Low connectivity** forces offline-first, which is just good engineering
- **Real problems** health, logistics, education, not another to-do app
- **Lean by default** no runway means you ship what matters
- **AI levels the field** a solo builder here can match a funded team

Capital still *helps.*

Funding buys speed and reach. It does not buy knowing which problem is worth solving. That part I already have.

Built here. *In production.*

An EMR, a supply-chain OS, and a family app, all shipped from Freetown with an AI-augmented stack.

YOUR MOVE

Building from an *emerging market?*

Drop your story in the comments. Let's compare notes.

DM me "MVP" if you want one built, wherever you are.
