

5 problems I want to solve *next*.

Where I am pointing the stack in the months ahead.

Worth *building.*

01 Stockouts that kill
Predicting medicine shortages before the shelf is empty.

02 Care that forgets
Patient histories that follow the person, not the clinic.

03 Health data in the dark
Turning field data into decisions leaders can act on.

04 Learning gaps
Tools that meet kids where their connection actually is.

05 Money confidence
Everyday financial habits, taught early and simply.

Real problems, *real users.*

Not features chasing a trend. Things that break in the real world and cost people something when they do.

Software should serve *where it's hardest.*

The places with the least infrastructure have the most to gain from tools that actually work.

YOUR MOVE

Working on one
of *these?*

Let's talk in the comments or my DMs.

DM me "MVP" if you want a partner who knows the terrain.
